Bulletin:	A100.50
Date:	9/1/96
Supersedes:	3/88

# ANDERSON SEPARATOR

## Line Type LC, LCF, LCR, LCC, & LCCR Separators

Anderson Type LC, LCF, and LCR Separators are designed to eliminate 99% plus of all liquid entrainment of 10 microns and larger. Type LCC and LCCR are designed to eliminate 99.9% of all liquid entrainment of 1 micron and larger from air,

gas, steam and vapor pipe lines without causing any significant pressure drop.

These separators are available for immediate shipment from stock for installations up to 600 PSIG and 500°F.

# Vertical Type LCC & LCCR Separators

Anderson LCC and LCCR vertical separators employ a specially designed coalescer element to remove finely divided liquid particles as minute as 1 micron from air, steam, gas or vapor lines.

These models are available for immediate shipment from stock for installations up to 600 PSIG and temperatures to 300°F. Also available for steam service up to 500°F.

Type LCR & LCCR Separators provide liquid storage for periodic blow down for light entrainment conditions.

All LC Type Separators must be installed in a vertical position with the flow from top to bottom for maximum entrainment separator.

All LC stock item separators have carbon steel body with stainless steel internal element.

All LC Type Separators can, on special order, be built and stamped to ASME Code for Unfired Pressure Vessels suitable for use in a wide range of pressure and temperature, and/or are available in all stainless steel construction.

# ANDERSON SEPARATOR

## Line Type L, LS and LUS Separators

All Anderson Line Separators are designed to eliminate all liquid entrainment of 8-10 microns or larger from air, gas, steam and vapor pipelines without causing any significant pressure drop.

Line Type Separators operate on a patented two stage principle of separation that employs carefully controlled flow guiding the entrainment laden vapor through a series of vanes and baffles. Each component of the separating element is designed to obtain maximum separating efficiency. Briefly, in the first stage of the separation, impingement against a baffle removes

the larger droplets of entrainment.

In the second stage of separation, the separator removes the fine mist entrainment by utilizing centrifugal scrubbing action through a uniquely designed contact element. In each stage, the gas medium and the separated liquid are carefully and continuously guided for maximum efficiency. The separators are designed to handle large volume flow of a broad range of fluids. Self-cleaning and engineered without filters or moving parts, the separators are free from maintenance and repair.

### Type L Separators

Type L Separators from 2½" to 10" pipe sizes are available from stock in both 150 and 300 PSIG ratings.

Separators have forged steel flanges, welded steel bodies and stainless steel element blades.

# ANDERSON SEPARATOR

## Receiver-Type LR Separators

Type LR Separators are receiver type separators custom designed and engineered for handling heavy liquid loads and extremely large slugs of entrainment in vapor or gas handling systems. Consisting of an Anderson separator inside a large receiver, the sudden reduction of velocity that occurs once the gas or vapor flow passes the inlet, causes a large percentage of the entrainment to drop to the bottom of the separator. Any entrainment remaining is virtually eliminated by the centrifugal action of the separator inside the receiver.

Three inlet/outlet configurations are available to meet the widest range of installation requirements. Other nozzle arrangements are available upon request. Receiver Type LR Separators are installed in the vertical position only as shown. All vessels are designed, built, and stamped to ASME Code for Unfired Pressure Vessels.

Separators have forged steel flanges and welded steel bodies. All separators are available in alloy steel, monel or other metals.

# ANDERSON SEPARATOR

## Vane-Type Separators

Anderson vane separators contain corrugated profile blades within a large receiver. This separator is built specifically for linear flow applications removing virtually all entrainment of 8 - 10 micron size or larger from the vapor or gas line. Entrainment laden flow is directed into the blades where it is split into individual vertical streams. A series of short radius turns within close proximity utilize inertial forces to trap heavier liquid droplets. Collecting as a film on the profile blades, the liquid flows along the blade and into phase collecting pockets where it deposits into a collecting sump. Because of its special design, Anderson vane separators can handle a large volume of liquid laden flow without re-entrainment. Additionally, the low drag coefficient of the profile design permits the handling of high velocities without excessive pressure loss.

Separators have forged steel flanges and welded steel bodies. All separators are available in alloy steel, monel or other metals.

All vessels are designed, built, and stamped to ASME Code for Unfired Pressure Vessels.

### Optional Base Supports for all Vertical Separators

In order to satisfy as wide a range of installation needs as possible, Anderson Separator models are available in three types of base support arrangements. Anderson

separators also come with many other options such as sight glass and a selection of control connections. For complete details contact the factory.

## Coalescer Type C Separators

Type C Horizontal Line Separators are capable of removing finely divided liquid particles (3 microns and larger) suspended in industrial and natural gas lines. The entrainment laden gas enters the separator through a unique coalescer element where the finely divided liquid particles agglomerate. Then the gas flow impinges against a baffle where the larger droplets of entrainment are removed. The remaining fine mist entrain-

ment is then removed by the centrifugal scrubbing action of the separator element. The gas, free of entrainment, passes through the outlet and the separated liquid is carefully directed to the drains. Receiver Tank design is available upon request. The vessels can be furnished with hinged closure or a blind flange and davit arm assembly.
